# Importance of hydro-macrophytes in the lake ecosystem

Introduction

Material and Method

Results

Discussion

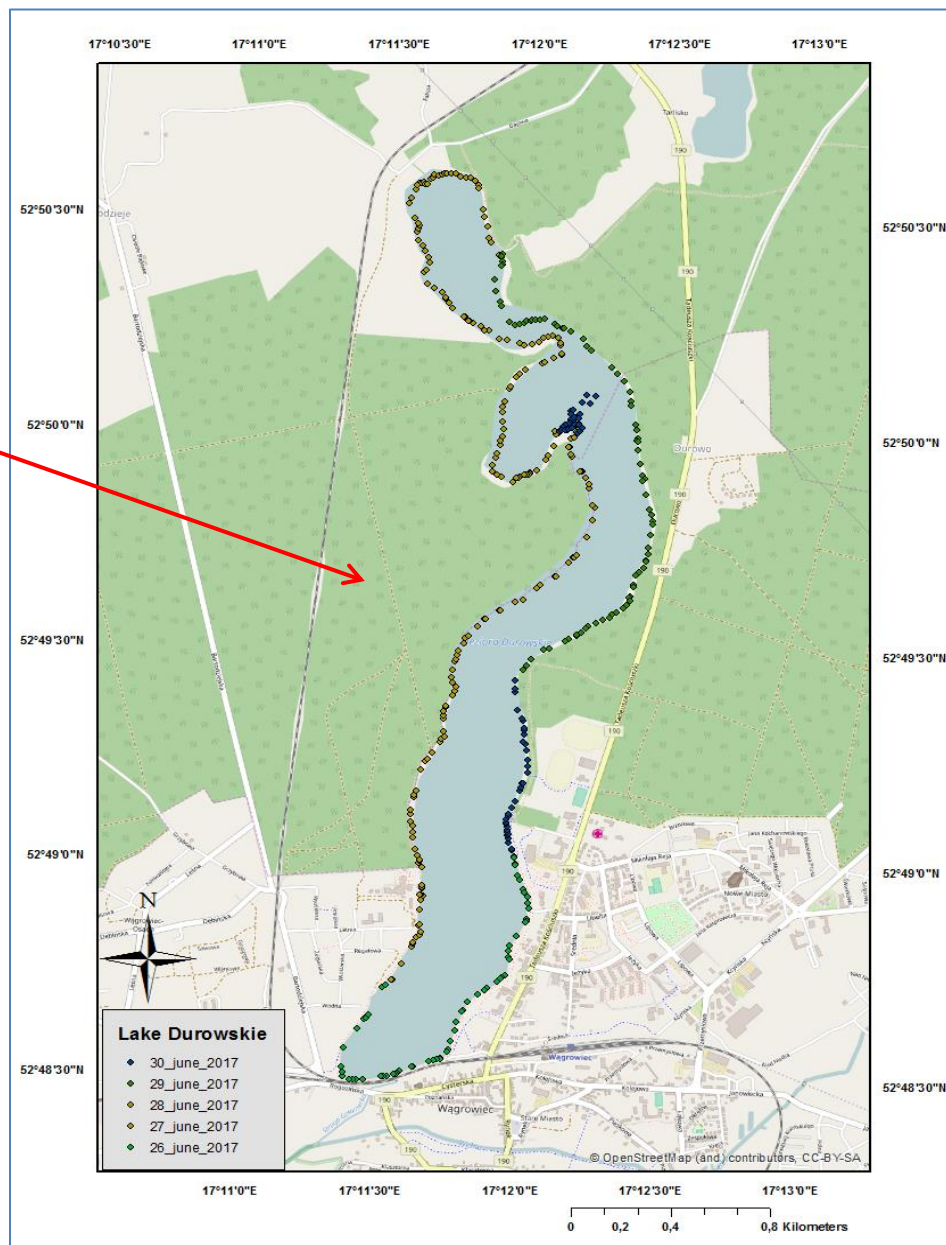

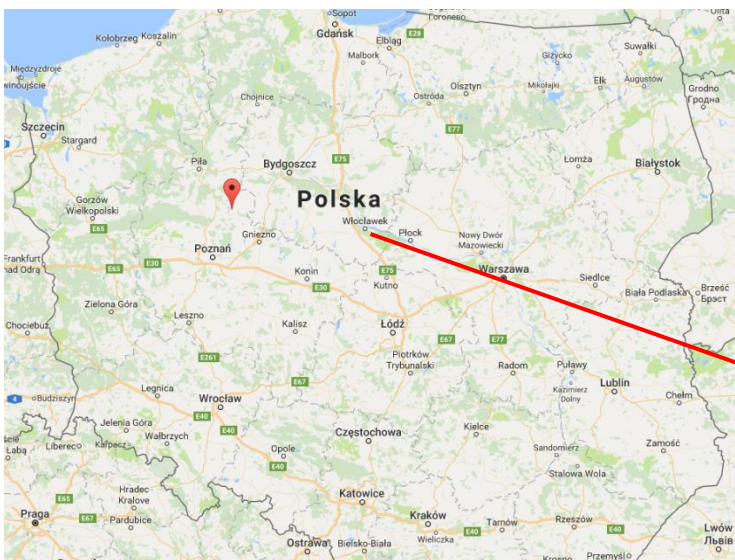

Recommendation

# Objectives

- ❖ To map all associated macrophytes present in the littoral zone of the Lake.
- ❖ Compare macrophyte associations and their share in the vegetation of the lake with previous years.
- ❖ To assess the Ecological status of the lake and the outflow.

# Study site

<b>Total area</b>	<b>143.7ha</b>
<b>Volume</b>	<b>11322.9 m<sup>3</sup></b>
<b>Maximum depth</b>	<b>14.9m</b>
<b>Average depth</b>	<b>7.9 m</b>
<b>Main tributary</b>	<b>Struga Gołaniecka</b>

# Field work **Or** Boat work???

- ❖ **Determination of plant associations of the lake and the outflow.**
- ❖ **Taking coordinates and coverage of plants associations.**
- ❖ **Measuring maximum depth of the presence of macrophytes.**

# Data analysis

# Data analysis

## Water Framework Directive (WFD, 2000)

### ❖ Ecological State of Macrophyte Index (ESMI)

$$ESMI = 1 - \exp\left[-\frac{H}{H_{max}} \cdot Z \cdot \exp\left(\frac{N}{P}\right)\right]$$

Ecological status	ESMI Index
Very good	0.680-1.000
Good	0.340-0.679
Moderate	0.170-0.339
Poor	0.090-0.169
Bad	<0.090

### ❖ Macrophyte Index for River (MIR)

$$MIR = \frac{\sum L_i * W_i * P_i}{\sum W_i * P_i} * 10$$

Ecological status	MIR Index
Very good	≥44.5
Good	(44.5-35.0>
Moderate	(35.0-25.4>
Poor	(25.4-15.8>
Bad	<15.8

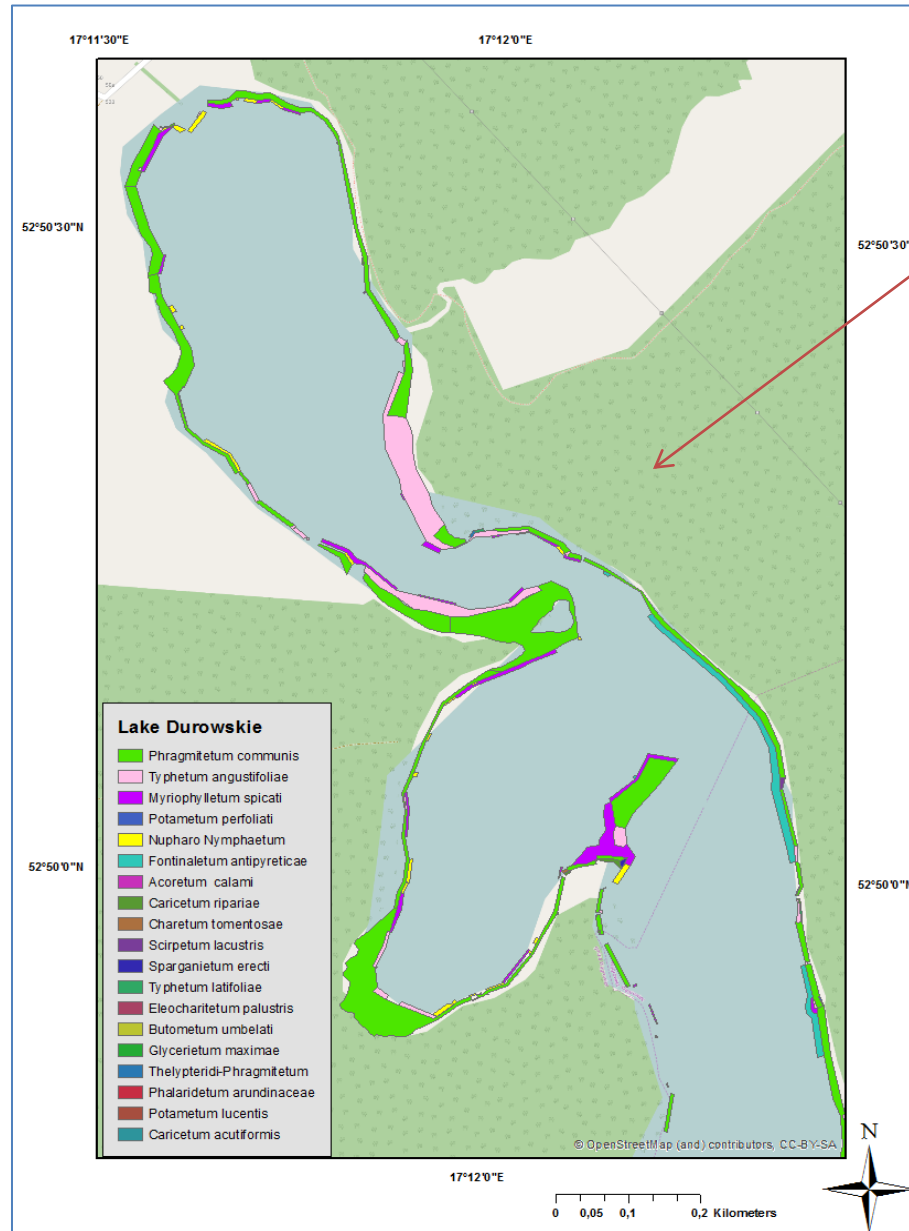

# Results

- ❑ 19 associations of the hydro-macrophytes were identified.
- ❑ Total area covered by macrophytes is 96,611.8 m<sup>2</sup>.
- ❑ *Phalaridetum arundinaceae* reappear in the lake after 2012.

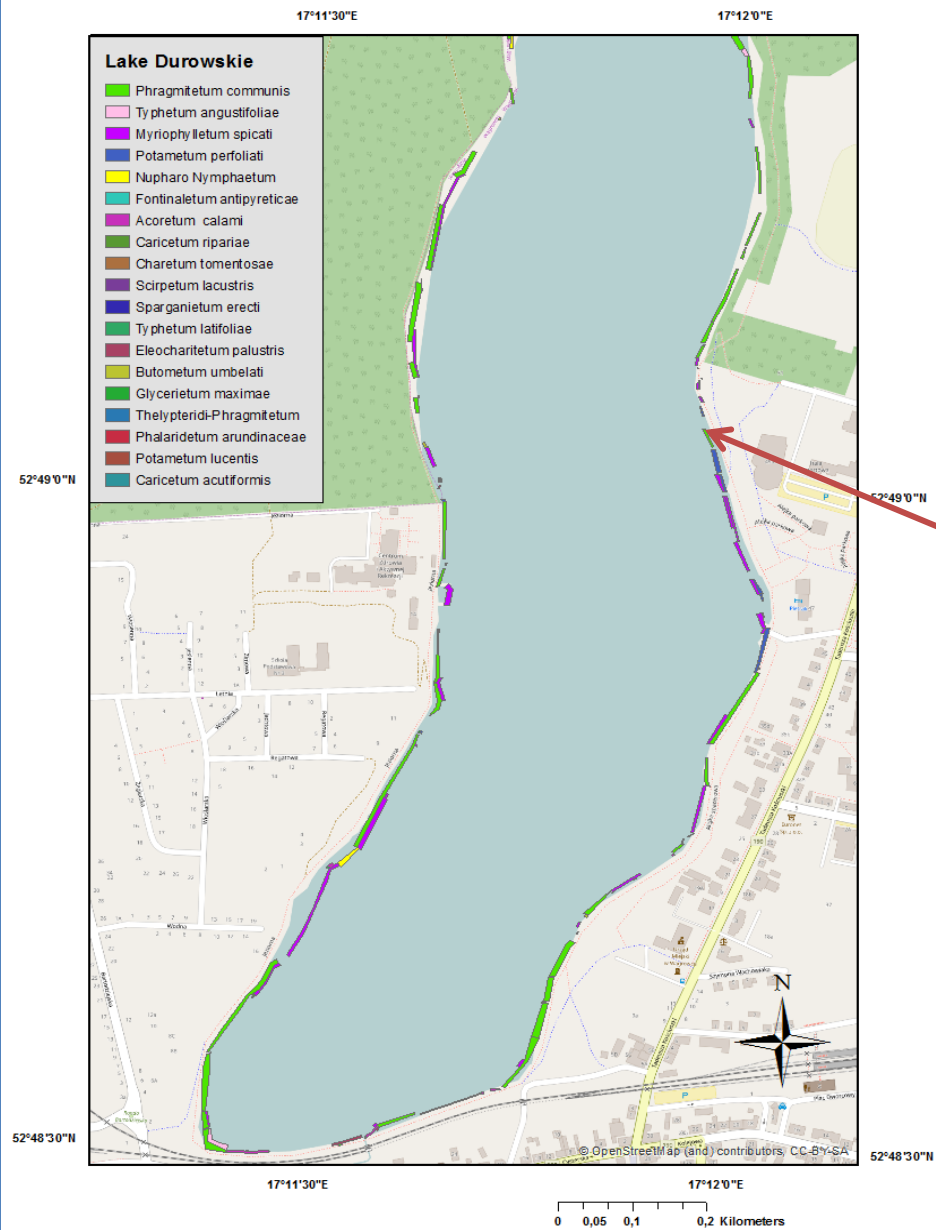

# Northern part of the Lake

# Southern part of the lake

*Phragmitetum communis*

*Typhetum angustifoliae*

*Myriophylletum spicati*

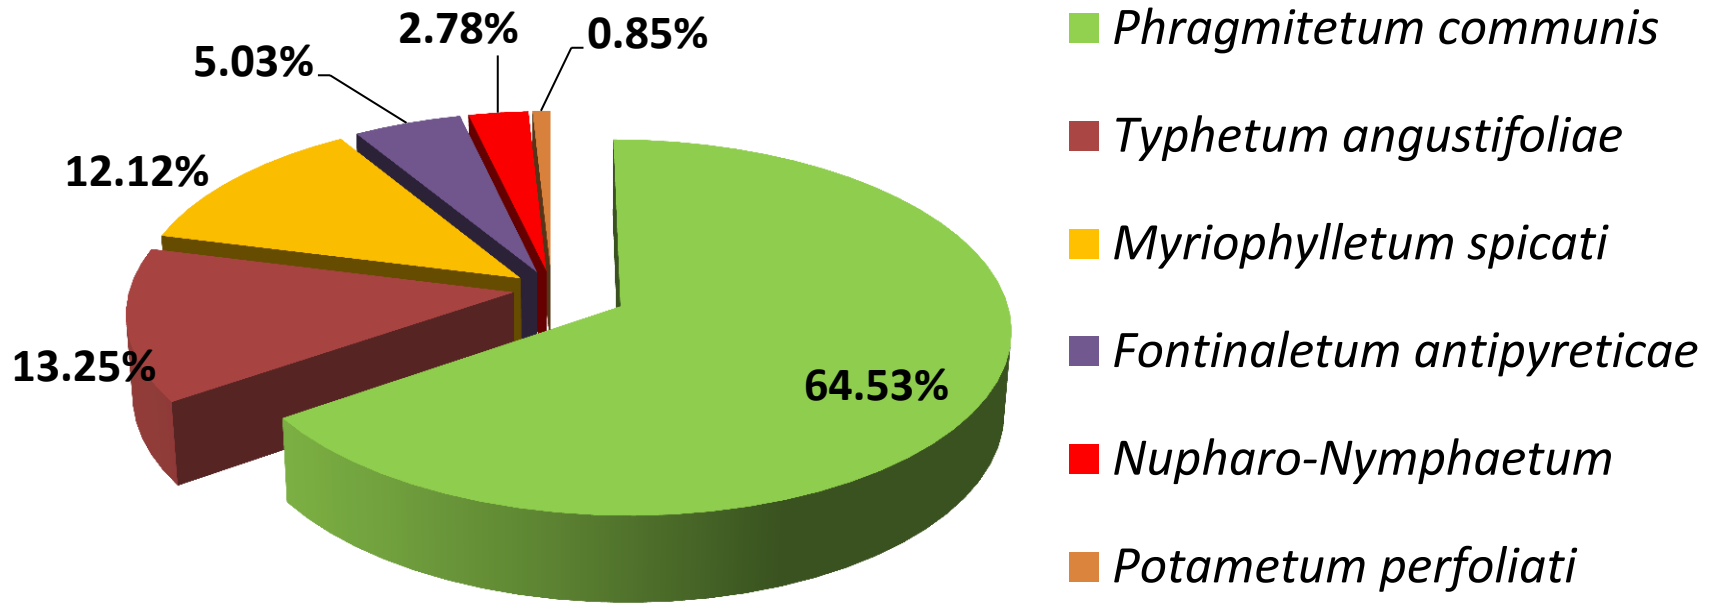

*Fontinaletum antipyreticae*

*Nupharo-Nymphaeetum*

# Dominant associations of macrophytes in percentage coverage

# Comparison of submerged association's cover area (2009-2017)

Introduction

Material and Method

Discussion

Conclusion

## Comparison of emergent association's cover area (2009-2017)

## Comparison of ESMI and MIR with previous years

Index	2009	2010	2011	2012	2013	2014	2015	2016	2017
<b>ESMI</b>	0,109	0,103	0,118	0,12	0,136	0,149	0,142	0,171	0,18
<b>MIR</b>	30,6	31,7	29,8	33,41	26,05	28,95	36,36	37,75	29.09

Ecological status	ESMI Index	MIR Index
Very good	0.680-1.000	≥44.5
Good	0.340-0.679	44.5-35.0>
Moderate	0.170-0.339	35.0-25.4>
Poor	0.090-0.169	25.4-15.8>
Bad	<0.090	<15.8

# Species Composition in the outflow

16 plant species along with two algae species

Plant species	Coverage (%)
<i>Butomus umbellatum</i>	25
<i>Acorus calamus</i>	1,5
<i>Phalaris arundinacea</i>	2
<i>Potamogeton pectinatus</i>	3
<i>Myriophyllum spicatum</i>	4
<i>Mentha aquatica</i>	1
Alage	
<i>Cladophora glomerata</i>	8
<i>Hildenbrandia rivularis</i>	1

# Discussions

- ❖ Decrease in total coverage area by about **2%** from 2016
- ❖ Submerged plants increased by **23%**
- ❖ *Phragmatitum communis* decreased by **10%**
- ❖ *Myriophylletum spicati* increased by **3.8%**
  
- ❖ Increased ESMI value from **0,17** to **0,18** although classes remained constant.
- ❖ MIR value decreased from **37,75** to **29,09** and classes from good to moderate.
  
- ❖ Macrophytes may also respond slowly due to season and shadow effects from trees.

# Recommendations

- Replant Chara species in different part of the lake.
- Disperse submerged species in different part of the lake with Turions.
- Ensure the protection of littoral zone of the Lake Durowskie.
- Take restoration initiatives for the upstream lakes.
- Develop proper code of conduct for establishing jetty for angling.

## Use hydro-macrophytes as a method for lake restoration (Xu et al 2014).

- eg. mowing and removal of small patches of emergent macrophytes in the littoral zone.
- Winter season is most appropriate considering the effect of trampling

# Thank you all..
